

3 types of chameleons that make the best pets

Veiled chameleons

Veiled Chameleons are, without a doubt, one of the most popular species in the reptile trade. This is thanks, to their ease of care and beautiful coloration. The body is typically covered in bands of yellow, green, and brown. But like many chameleon species, this kind can change color on a dime. These lizards are known to flash some beautiful colors!

In terms of care, Veiled Chameleons are quite manageable. They tolerate a decent range of temperatures and will thermoregulate whenever they need some adjusting.

Contrary to popular belief, Veiled Chameleons don't like to be held. They can get stressed out when handled too much.

Panther chameleon

Panther Chameleons are colorful creatures that can take on a spectrum of vibrant hues. These lizards change their color to communicate with one another and absorb radiant heat. You might see them take on shades of turquoise, red, green, and more.

Generally, males are more colorful than females. But, female Panther Chameleons can alternate between beautiful shades of pink and high-contrast tones of red or black. In most cases, the color change in females all depends on their receptiveness to breeding.

Panther Chameleons are solitary animals. They can get territorial with others, so they prefer to live alone.

This chameleon species isn't too keen on handling, either. While not particularly aggressive, excess handling could lead to unwanted stress.

Jackson's Chameleon

The Jackson's Chameleon is another popular species with a distinct look. Its most identifying feature is its horns. Male specimens have three horns on their face. Two are located below the eyes while a larger horn sits on the nose. These chameleons also have thick spiny ridges running along the entire back.

When first born, these lizards take on a brown color. But, they quickly develop their signature green hue after several months. Green is the primary color, but you may also see splashes of blue or yellow. Those colors are most common around the face.

Jackson's Chameleons are very territorial. They should be housed alone to prevent any aggressive behavior or fighting. These lizards also don't like handling. Once you set up their new home, you should only handle them when you need to clean the enclosure.
